Fade Khalifah Rosyad

Accomplished and solutions-driven DevOps Engineer with over 4 years of experience building, automating, and optimizing cloud infrastructure across AWS and GCP. Proven track record in designing scalable, secure platforms using Kubernetes, Terraform, GitOps (ArgoCD), and service mesh (Istio) to support high-impact financial and enterprise applications. Skilled in cost optimization (up to 40% savings), regulatory compliance (ISO 27001, and Bank Indonesia Regulation), and enabling developer velocity through CI/CD automation. Adept at cross-functional collaboration and process improvement.

Open to relocation opportunities abroad, and highly motivated to contribute within multicultural, fast-paced engineering environments.

Professional Experience

Career Break

September 2025 - Present

Intentional career break to reset pace, reflect on long-term career direction, and prepare for a sustainable return to full-time platform engineering work.

PT. Karya Perkasa Indomitra (CFX Group), Jakarta

Site Reliability Engineer

November 2024 - August 2025

Karya Perkasa Indomitra is internal outsource for CFX group that help CFX to developing their systems

- Engineered and manage CFX Group infrastructure on AWS cloud
- Developed and implemented VPC Endpoints using AWS PrivateLink to enhance security and isolation for broker services

Stack: Bash, Terraform, Docker, Kubernetes, Istio, Github Action CI/CD, Vault, AWS(EC2, S3, EKS, ElastiCache, RDS), PostgreSQL, Git, Tailscale VPN, Datadog, Grafana, Prometheus

PT. Pintu Kemana Saja (Pintu), Jakarta

Site Reliability Engineer

April 2024 - November 2024

Engineered and managed the end-to-end infrastructure for Pintu Perpetual, including:

- Developed and deployed an ArgoCD-based CI/CD pipeline leveraging GitHub Actions to automate the build, test, and deployment of microservices for the Pintu Perpetual product

- Architected and deployed a secure and scalable AWS infrastructure, including VPCs, subnets, security groups, network ACLs, and managed Kubernetes clusters (EKS) with node autoscaling to handle the Pintu Perpetual product
- Developed and maintained comprehensive monitoring and observability solutions using Prometheus and Grafana, creating custom dashboards and alerts to proactively identify and resolve performance bottlenecks and system issues
- Collaborated in reorganizing Istio gateways and streamlining documentation to reduce technical debt and improve operational efficiency

Stack: Bash, Terraform, Docker, Kubernetes, Istio, Gitlab CI/CD, Vault, AWS(EC2, S3, EKS, ElastiCache, RDS), PostgreSQL, Git, Tailscale VPN, Datadog, Grafana, Prometheus

PT. Orange Inovasi Indonesia (ByOrange), Jakarta

Devops Infra Engineer

April 2023 - April 2024

- Collaborated with the Information Security Team to prepare and implement swing mechanisms for Bank Indonesia regulatory compliance and ISO 27001 certification
- Contributed to ISO 27001 certification efforts by managing infrastructure-related aspects, including data backup and recovery, capacity planning, and change management
- Managed communication and collaboration with third-party vendors for GCP and Gitlab, ensuring seamless integration and efficient support
- Achievement:
    - Implemented Workload Identity for infrastructure on/off and performance testing environments, enhancing security by eliminating the need to store service account credentials and minimizing the risk of credential compromise
    - Streamlined the infrastructure on/off pipeline by consolidating 16 product repositories into a single repository with call procedures for each project, improving code maintainability and reducing deployment complexity
    - Collaborated with the Backend Infrastructure team to plan and execute cloud cost reduction strategies on Google Cloud Platform, achieving a 40% reduction in monthly costs through optimization of resource utilization and implementation of cost-effective solutions

Associate Devops Infra Engineer

December 2020 - April 2023

- Provisioned and managed infrastructure for 11 company products using Terraform and Ansible, adhering to the DRY (Don't Repeat Yourself) principle by maintaining a centralized Git repository for infrastructure code

- Designed, developed, and managed centralized CI/CD pipelines for 8 products within a single repository, automating the build, test, and deployment processes to ensure consistent and efficient software delivery
- Developed and implemented a mechanism using Gitlab Pipeline to provision on-demand, immutable infrastructure for pre-production performance testing (load testing), enabling realistic testing environments and improving application reliability
- Managed and provided guidance to internal teams and stakeholders on service deployment cycles, including best practices for Dockerfile creation, Kubernetes manifest configuration, and Istio manifest management
- Led the onboarding of a sister company to Google Cloud Platform, including infrastructure migration and knowledge transfer, ensuring a smooth transition and successful cloud adoption
- Researched and evaluated emerging technologies such as Datadog, Argo CD, and Teleport to identify opportunities for improving development processes and infrastructure management
- Achievement:
    - Migrated CI/CD tooling from on-premise Jenkins to Gitlab CI/CD SaaS, coordinating with stakeholders to ensure minimal disruption and maintain project continuity
    - Reduced cloud costs by implementing a time-based scaling mechanism (infrastructure on/off) using Google Cloud Scheduler to trigger Gitlab pipelines, optimizing resource utilization and minimizing unnecessary spending
    - Implemented preemptible nodes for Gitlab Runner and non-production environments, achieving a 35% reduction in monthly costs without impacting development velocity

Stack: Bash, Terraform, Ansible, Docker, Kubernetes, Istio, Gitlab CI/CD, Vault, GCP (GKE, GCS, GCE, Memorystore), MySql 8 (CloudSQL), Git, Pritunl VPN, Datadog, velero

PT. Advotics Teknologi Global (Advotics), Jakarta

Junior Software Development Engineer

August 2019 - December 2020

- Developed software features based on product requirements, including the creation of dashboards and reports for data visualization, the design and implementation of ETL process jobs for data transformation, and the development of integration endpoints to connect with external services
- Maintained ETL processes by monitoring cron jobs and performing manual data manipulation as needed to ensure data accuracy and integrity

Stack: Java 8, MySql 5, Git, AWS RDS, AWS S3

Certificates

Certified Kubernetes Administrator — *Linux Foundation*

October 2026 - October 2028
ID: LF-gikm7ci2o1

Education

Computer Engineering, Universitas Indonesia — *Bachelor*

August 2015 - August 2019
Topic of interest:
Software Development, Computer Networking and Security, Computer Architecture, System Architecture, Project Management
GPA: 3.32
